

Sales Performance Analysis Report

1. Project Overview

This project analyzes retail sales performance using transaction data. The analysis focuses on identifying sales trends, category performance, regional performance, top-performing products, and profit-related risks. The goal is to help the business understand which areas contribute the most to sales and profit, as well as identify opportunities for improvement.

2. Business Problem

The business needs to understand overall sales performance in order to make better decisions related to product strategy, promotion, and profitability. Several key questions were analyzed, including which product category generates the highest sales, which region performs best, which products contribute the most revenue, and whether high sales always lead to high profit.

3. Dataset Overview

The dataset contains 1,000 sales transaction records. Each transaction includes information such as order date, customer segment, city, province, region, category, sub-category, product name, quantity, unit price, discount, sales, cost, profit, payment method, order month, shipping days, and profit margin.

Based on the analysis, the dataset generated:

- Total Sales: 3,904,028,110
- Total Profit: 676,816,808.73
- Total Quantity Sold: 3,012
- Total Orders: 1,000
- Profit Margin: 17.34%

4. Analysis Process

The analysis was conducted through several steps. First, the dataset was checked for missing values and no blank values were found in the main columns. Additional columns such as order_month, shipping_days, and profit_margin were added to support further analysis.

After that, pivot tables were used to explore sales and profit patterns by category, region, month, and product. SQL queries were also created to validate the results and perform deeper analysis, including total sales, sales by category, sales by region, top products, negative profit transactions, and high-discount transactions. Finally, the results were visualized using Power BI Dashboard.

5. Key Insights

No	Insight Area	Key Insight
1	Overall Performance	The business generated total sales of 3.90 billion and total profit of 676.82 million, with an overall profit margin of 17.34%.
2	Category Performance	Technology is the strongest category, contributing the highest total sales and total profit compared to Furniture and Office Supplies.
3	Quantity vs Revenue	Office Supplies has high quantity sold, but its total sales remain the lowest because the products have relatively lower prices.
4	Regional Performance	West has the highest sales, but East generates higher profit. This shows that the highest revenue region is not always the most profitable region.
5	Monthly Trend	Sales fluctuate across months, with the highest sales occurring in 2025-02. Monthly sales trends can help the business plan campaigns more effectively.
6	Top Product	Business Laptop 14 inch is the top product by sales and profit, making it one of the most important products for the business.
7	Profit Risk	Some transactions have negative profit, indicating that certain sales may be affected by high discounts or high cost.
8	Discount Risk	Transactions with high discounts need to be monitored because they can reduce profit margin and potentially create losses.

6. Business Recommendations

Based on the analysis, several recommendations can be made.

First, the business should prioritize the Technology category because it contributes the highest sales and profit. Products in this category, especially Business Laptop 14 inch, should be maintained with strong stock availability and supported with targeted promotion.

Second, the business should not only focus on total sales, but also monitor profit margin. The comparison between West and East shows that higher sales do not always result in higher profit. Therefore, regional strategies should consider both revenue and profitability.

Third, high-discount transactions should be reviewed carefully. Discounts can help increase sales volume, but excessive discounting may reduce profit or even create negative-profit transactions. The business should set clear discount limits based on product margin.

Fourth, Office Supplies can still be useful as a high-volume category, but it should not become the main driver for revenue growth. The business can use Office Supplies as

supporting products or bundle them with higher-value products such as laptops, printers, or office furniture.

Finally, monthly sales trends should be used to plan future campaigns. Since sales performance varies across months, promotion and stock planning should be aligned with periods that show higher sales potential.

7. Conclusion

The analysis shows that the business has strong sales performance, especially from the Technology category and key products such as Business Laptop 14 inch. However, profitability should remain a major focus because some high-sales areas may not always produce the highest profit. By monitoring product performance, regional profitability, discount impact, and monthly trends, the business can make better decisions to improve both revenue and profit.
